SIRR — SITE IMAGING READINESS RECORD

Site self-assessment and boundary

Study / Protocol	Site / Code	SIRR Record ID	Self-assessment Status
Device / System	Procedure Family / Anatomical Field	Assessment Date	Reassessment Date / Trigger
Applicable Protocol / Sponsor Imaging Charter or Manual / Version		Radiology Function / Contact	Controlled Record Location

A Purpose, Decision and Boundary

This site record confirms whether local imaging arrangements can implement the current protocol and sponsor-controlled requirements. It records evidence, gaps and actions without replacing the sponsor's Imaging Charter, imaging manual or protocol.

Decision produced: Is the site ready to submit its imaging arrangements for sponsor or CRO review? This is a site self-assessment and does not authorize activation.

B Local Implementation Model and Record Linkage

Use the current sponsor-controlled source and version. Record only the evidence needed to demonstrate local implementation; do not reproduce the source document.

Implementation element	What the site verifies in this record	Controlled source or linked evidence
Acquisition	Required modalities, views or sequences, positioning, laterality, technical minima and permitted windows have been mapped to a feasible local acquisition workflow.	Current protocol, sponsor Imaging Charter or manual, radiology work instruction and equipment evidence.
Display, transfer and archiving	Local naming, display, transfer, archive, completeness and retrievability processes can meet the sponsor-controlled requirements before routine use.	Sponsor transfer instructions, local archive / image system, transfer test and controlled record location.
Local review	Named local roles, review documentation and routes for second review or clinical escalation are available and do not replace sponsor-defined central review.	Delegation and training evidence, local review route, participant source, PI review and central-review instructions.
Timing and maintenance	Required time points and windows can be scheduled locally, and equipment maintenance or calibration evidence is current and traceable.	Sponsor-controlled schedule, visit workflow, calibration / maintenance record, PFVR, FUCR or IMC where applicable.

C Alignment of Image-Set Quality Classification and Local Response

Use these categories only when they match sponsor terminology. Otherwise, retain the sponsor classification and map the corresponding local response.

Classification	Use this when	Minimum documented response
Acceptable	The required modality, views or sequences are complete, technically sufficient, traceable and within the applicable timing scope.	Record the archive / transfer reference and local review date where required; proceed through the defined review pathway.
Limited	A technical limitation exists, but the required image set is available and potential usability can be determined by the defined review process.	Describe the limitation, document whether the affected decision remains supportable and obtain second review where the applicable sponsor-controlled source requires it.
Non-conforming	A required view, sequence, timing requirement, transfer, identifier or technical minimum is missing or unusable for the intended purpose.	Determine feasibility of repeat acquisition or recovery; document impact, immediate response and linked action or deviation record.
Not assessable	The image set, transfer evidence or qualified local review is unavailable, so its technical acceptability or usability cannot be determined.	Do not infer usability. Recover the missing evidence or document the limitation and escalate if an imaging-dependent decision is affected.

SIRR — SITE IMAGING READINESS RECORD

Requirements mapping and technical readiness

D Local Implementation Mapping of Sponsor-Controlled Imaging Requirements

For each applicable imaging requirement, cite the sponsor-controlled source and record the local workflow, status and any gap, action or evidence.

No.	Sponsor source / section	Time point / purpose	Modality / views / parameters	Local equipment / workflow	Implementation status	Gap / action / evidence

E Site Self-Assessment of Technical Controls and Local Readiness

Readiness or technical control	Current reference / evidence	Status	Limitation, action or next review
Equipment, maintenance and calibration relevant to required imaging		☐ Confirmed ☐ Pending ☐ N/A	
Local archive, naming convention, transfer and retrievability pathway		☐ Confirmed ☐ Pending ☐ N/A	
Radiology liaison or technical acquisition function		☐ Released ☐ Restricted ☐ Pending	
Local reviewer, second-review route and clinical escalation route		☐ Defined ☐ Partial ☐ Not defined	

F Named Local Roles, Review Boundary and Escalation Route

Assign each local implementation function to a named person or role through the applicable delegation and training records. The radiology liaison coordinates technical acquisition and transfer consistency; the local clinical reviewer applies the sponsor-defined or documented local review criteria; and the PI resolves clinically meaningful imaging-dependent decisions. Site-level roles do not replace sponsor oversight, central review or endpoint adjudication.

Local function	Named person / role	Permitted activity within the imaging process	Training / delegation / linked evidence
Radiology liaison / technical acquisition		Coordinates technical adherence, acquisition consistency, transfer and escalation of non-conforming image sets.	
Local clinical imaging reviewer		Applies the defined local review criteria and refers clinical discrepancies or concerns through the established route.	
PI / accountable clinical decision		Resolves clinically meaningful imaging-dependent decisions or escalation requiring investigator judgment.	

H Readiness of Local Imaging Documentation Pathways

Sponsor requirement or scenario	Local record / system	Responsible role	Pathway status	Gap, action or evidence
Technically acceptable image set			☐ Defined ☐ Partial ☐ Not defined	
Limited or non-conforming image set			☐ Defined ☐ Partial ☐ Not defined	
Image-dependent clinical or eligibility decision			☐ Defined ☐ Partial ☐ Not defined	
Repeat acquisition or corrected transfer			☐ Defined ☐ Partial ☐ Not defined	
Recurrent issue requiring sponsor/CRO escalation			☐ Defined ☐ Partial ☐ Not defined	

SIRR — SITE IMAGING READINESS RECORD

Site conclusion and activation reference

I Current Site Imaging Readiness Self-Assessment

Complete this conclusion after the site has reviewed its implementation evidence against the current sponsor-controlled imaging requirements. The conclusion documents the site's position for sponsor or CRO review; it does not authorize site activation, participant enrollment or imaging use.

Site conclusion	Meaning and required next step	Assessment date / reassessment
Ready for sponsor review	☐ The site has evidenced the applicable local controls and submits the imaging scope for sponsor or CRO qualification and activation review.	
Ready with observation for review	☐ A documented observation remains visible to the sponsor or CRO and does not appear to prevent implementation of the defined scope.	
Action required before activation	☐ An equipment, workflow, training, transfer or review control requires completion before the site requests activation.	
Not ready / escalated	☐ The site cannot currently implement the applicable imaging requirements or requires sponsor clarification before proceeding.
